A Mini Dental Implant Alternative to All-on-Four

INTRODUCTION
Aesthetic dentistry has evolved throughout the past few decades, significantly in the field of implantology. Patients are preferring endosseous procedures to traditional dentures and other removable prostheses to increase stability and comfort, and to decrease pain. Conventional implants require several procedures involving multiple appointments and upwards of a year until completion; although some newer techniques promote a faster completion time. The "All-on-4" technique is an immediate conventional implant procedure in which four large-diameter implants (two in the anterior and two in the posterior) are inserted at a 45° angle to take advantage of the available bone and to reduce the need for bone augmentation and/or sinus lift.

According to Nobel Biocare’s All-on-4 treatment concept manual, a minimum of 5.0 mm in bone width and 8.0 mm in bone height is necessary to begin the procedure. All-on-4 is a registered patent owned by Nobel Biocare developed together with Paulo Malo, DDS, PhD at the Malo Clinic. Though the All-on-4 technique claims to eliminate the need for bone augmentations and sinus lifts, these procedures cannot always be eliminated if the bone quantity does not meet the requirements due to the large diameter of a conventional implant.

While the All-on-4 technique offers acceptable support with four implants, the endosseous procedure is still invasive and time consuming compared to the immediate and early loading procedures used with mini dental implants. The All-on-4 often requires a minimum of 4 to 6 months before the final restoration is fully completed. In addition, if one of the four implants fails to integrate, a secondary surgery involving placement of the restoration, the entire restorative procedure must be restarted, additional surgery performed, and the restoration remake. Considering the average fee for All-on-4 is in the range of $30,000 to $40,000 per dental arch, this technique is not affordable for most dentists.

Technique Using Mini Dental Implants

Recently Introduced

Immediate and early loading endosseous procedures with mini dental implants are more desirable to patients in many instances because of the speed of completion, an affordable fee, and it is a less invasive procedure with reduced postoperative discomfort. The small size of the mini dental implants (available in several lengths and diameters) eliminates the need for bone augmentation and/or sinus lift. This is because the mini dental implant can be angled into available bone rather than augmenting the bone. The Shaklin Fabricated Implant Restoration and Surgical Technique (F.I.R.S.T.) (patent USPTO No. 7,198,518) B, September 2006, developed by Todd E. Shaktin, DDS, provides for mini dental implant(s) to be placed and restoration(s) cemented in one patient visit. The most recent innovation, FIX on SIX (FIX on SIX is a registered trademark owned by Shaklin F.I.R.S.T. developed by Todd E. Shaktin, DDS) offers a combination of the Shaklin F.I.R.S.T. technique using 6 to 10 (or 12) mini dental implants with a 2-unit fixed detachable zirconia full arch restoration with a 6-ring implant housings. The restoration is only removed and recall cleanings at the dentist is able to snap off the FIX on SIX restoration. The hygienist will then completely clean the implant, the restoration, and the surrounding tissue and easily reinsert the restoration without patient discomfort. This FIX on SIX procedure is completed in a fraction of the patient’s and the dentist’s time as required by the All-on-4 technique. The success rates of the immediate loading mini dental implant endosseous procedures are competitive with the All-on-4 technique. If one of the mini dental implants were to fail with a FIX on SIX restoration, the failed mini implant can be easily replaced with a new mini implant and a ring housing placed in the same or different location. In addition, the FIX on SIX restorations are considerably more affordable than the All-on-4 with approximately 2.37% to 66% savings. Consequently, the FIX on SIX restorations are more desirable to the patient due to their affordability, greater comfort, reduced treatment time, and the less invasive nature of the procedure.

Fixed partial dentures are commonly supported by mini dental implants to provide a natural, aesthetic appearance for the patient. In recent years, zirconium dioxide (Zirconia) frameworks have been used in dentistry for fixed restorations. The introduction of zirconium has allowed the fabrication of metal-free frameworks via CAD/CAM technology. The result is improved aesthetics with increased success and reliability. There is also
A Mini Dental Implant Alternative... continued from page 96

evidence that there is less plaque accumulation on zirconia, helping to prevent postoperative gingival problems. The architecture of these zirconia-based prosthetics enables superior strength and chewing resistance on the posterior teeth relative to other ceramics. Due to its favorable chemical composition and mechanical properties, clinicians have been eager to use zirconia in implant-supported restorations after its continued success in tooth-supported restorations.

The following case study (Figures 1 to 13) presents a clinical report of mini dental implants with the FIX on SIX technique. The use of 6 to 8 (or 10) mini dental implants allows for the functional and esthetically pleasing zirconia fixed prosthesis to be supported. Using CBCT technology, a zirconia prosthetic restoration was created and fixed over the Shatkin E.R.I.S.T. mini dental implants (by Intra-Lock) using o-ring housings pressed into the zirconia framework.

CASE REPORT

A 58-year-old male patient with an upper denture presented for a consultation on May 13, 2018. He had come in after seeing the Shatkin E.R.I.S.T. television marketing campaign. At the consultation, our new patient had a CT scan (using our Shatkin E.R.I.S.T. CBCT machine for pre-op and post-op scans in Figure 1), treatment plan, and impressions taken for a FIX on SIX detachable-removable (on Six) implant. To minimize the discomfort and to eliminate the existing issues with his old denture, a zirconia bridge was prescribed and designed to fit on the mini dental implants that would be placed. Zirconia was chosen as the fabrication material due to its strength and durability and resistance to plaque. A treatment plan for placing 10 Mini Drive-Lock (MDL) Intra-Lock in the maxillary arch using the Shatkin E.R.I.S.T. technique for mini dental implant placement was chosen. He was asked to return in 2 weeks to begin the procedure and placement of a temporary bridge.

About one month later, the patient returned, signed the consent form, and treatment began. A local anesthetic (2 carcups of Sepracine with epinephrine) was administered. A CT-guided stent from Shatkin E.R.I.S.T. Lab was used in this case. The position of the 10 implants was marked using a Thompson marking pen and the CT-guided stent (Figure 3). Nine Intra-Lock mini dental implants were used on the upper maxillary arch, size 15 mm/15 mm at Nos. 5 to 8 and 9 to 13, and one 25 mm/11 mm for No. 8. The CT-guided stent was used throughout the procedure (Figure 4), removing it between final placement of each implant, using the patented E.R.I.S.T. technique. When finished placing all 10 implants using the Shatkin E.R.I.S.T. procedure, the housings were placed, and a 1 Luxatemp (DMG America) was used to create the temporary bridge. The patient liked the temporary. Impressions were taken and sent to the Shatkin E.R.I.S.T. Lab (Figures 5 to 8). Two prescriptions (penicillin 500 mg, Norco 5/325) were sent to the patient's pharmacy, and an appointment for 2 weeks was made for the delivery of the permanent FIX on SIX detachable-removable bridge.

Two weeks later, the patient returned, and the temporary was removed. The FIX on SIX detachable-removable roundhouse restoration was then placed (Figures 9 to 13). The FIX on SIX restoration had good aesthetics, and the patient was happy (Figure 13 to 15). The patient was given a Shatkin Water Flower...
and a Sorecare (Philips Oral Healthcare) toothbrush. These are provided as a part of the treatment to our mini implant patients for optimal home care. These have been very successful hygiene tools to keep the soft tissues healthy and clean between checkups, when the FIX on SIX is removed.

CLOSING COMMENTS

This article presents an alternative to All-on-4 that is less expensive, less invasive and painful, and demonstrates faster results while utilizing zirconia, a strong and biocompatible dental material. FIX on SIX is a beautiful zirconia restoration that can be removed by the clinician while providing the patients with the feed and aesthetics of a fixed prosthesis. Creating a fixed prosthesis that is capable of withstanding the occlusal forces applied, while providing cosmetic appeal and patient satisfaction, is an enduring task for all dentists. Today in dentistry, zirconia has traditionally been used in fixed partial dentures as tooth-supported restorations. With most cases that use zirconia as a fixed restoration, high success rates have been recorded, mostly higher than 95%. Zirconia’s ability to increase the durability of a prosthesis by up to 70% to 40% has made it a good candidate for use in fixed hybrid cases. The use of CT technology increases zirconia’s stability in conjunction with decreasing failure rates of these restorations, due to the individualization.

In this case study, the patient was satisfied with his upper denture because of cracks in the acrylic along the palate, and the dentures were not comfortable to wear, and food would trap under them. By designing a fixed zirconia bridge (FIX on SIX) instead of acrylic dentures or a hybrid acrylic fixed bridge, the patient will no longer experience these negative experiences. The use of zirconia instead of acrylic increases durability of the prosthesis while also offering the comfort of fixed restoration and healthier surrounding gingival tissues.
